

# Ghanshyam Mali

Full Stack Developer | NestJS | Next.js | MongoDB | TypeScript

+91 8999764387 | ghanshyams.mali@gmail.com | GitHub | LinkedIn | Portfolio

## PROFESSIONAL SUMMARY

Full-stack Developer with 2+ years of experience architecting scalable **multi-tenant SaaS** platforms and enterprise web applications using **React.js, Next.js, NestJS, Node.js, PostgreSQL**, and **MongoDB**. Skilled in designing secure **REST APIs** with **JWT authentication, RBAC**, and strict **tenant isolation**, deployed on **AWS (EC2/S3)**. Delivered measurable performance gains through **MongoDB indexing, API caching**, and **query optimization**, while streamlining delivery with **Docker, CI/CD pipelines**, and automated testing frameworks.

## TECHNICAL SKILLS

**Frontend:** React.js, Next.js, Redux, Material UI, JavaScript, TypeScript, HTML, CSS

**Backend:** Node.js, Express.js, Nest.js, REST APIs

**Database:** PostgreSQL, MySQL, MongoDB

**DevOps & Tools:** AWS (EC2, S3), Jenkins CI/CD, Docker, Git, GitHub, Postman, VS Code, Cursor

## PROFESSIONAL EXPERIENCE

**Full Stack Developer** | e-InnoSec Consulting LLC, Cedar Park, Texas

Jan 2026 – Present

- Led a cross-functional team of **3 full-stack developers and 2 interns** as a hands-on contributor, driving sprint planning, code reviews, and feature delivery for a multi-tenant **SaaS** platform
- Designed and built a full **RBAC (Role-Based Access Control)** system from scratch, along with **JWT-based authentication, tenant isolation**, and **audit logging** — securing **10,000+ users** across **10+ tenant organizations**
- Architected a multi-tenant **SaaS** platform using **NestJS, Next.js, MongoDB**, and **TypeScript**, scaling the application to support **10,000+ users** across **10+ tenant organizations**
- Built an embeddable **JavaScript SDK** (script-tag integration) enabling third-party client sites to capture and manage end-user data/consent in real time, with a self-service dashboard for users — achieving **95%+ API test coverage**
- Optimized **REST APIs** through **MongoDB indexing**, query tuning, and **caching strategies**, reducing average response times by **35–50%**
- Managed deployments across dev, demo, and production environments using **AWS, PM2**, and **Docker**, building **CI/CD pipelines** that improved release velocity and reliability

**Associate Software Developer** | NeoSOFT Technology Pvt. Ltd., Mumbai

July 2024 – Jan 2026

- Built and deployed a full-stack payment aggregation platform using **Stripe Connect (Custom accounts), React, Next.js, Node.js, Express**, and **PostgreSQL**, integrating **REST APIs** and webhooks for real-time transaction and payout updates
- Designed custom merchant onboarding flows and dashboards for **Stripe Connect Custom accounts** across **6+ regions** (US, UK, Japan, Germany, Sweden etc), handling region-specific compliance, identity verification, payouts, and fund transfers
- Implemented **Role-Based Access Control (RBAC)** and role-based dashboard login with a modular, optimized architecture — reducing code duplication by **20%** and improving maintainability by **15%**
- Developed reusable **React components, hooks, and utilities**, eliminating **30%** duplicate code and speeding up feature delivery
- Built complex onboarding/payout forms with **React Hook Form/Formik** and **Yup/Zod** validation, reducing form-related bugs by **~45%**
- Optimized performance via **lazy loading, memoization**, and **API caching** — **~40% faster page loads, ~35% lower API overhead**
- Managed **CI/CD pipelines** and deployments using **AWS, Jenkins**, and **GitFlow**, cutting manual deployment time by **~50%**

## PROJECTS

### VentureLens | [Next.js 15](#), [TypeScript](#), [NestJS](#), [MongoDB](#), [Redis](#)

[Live Demo](#)

- Architected and shipped a production-grade B2B **SaaS** where founders onboard tenants, submit startup ideas, and receive AI-generated validation reports (market analysis, SWOT, risk heatmap, 0–100 validation score, MVP roadmap, 90-day GTM plan) via **REST APIs** and an async **BullMQ** worker pipeline with **3x** concurrency, exponential backoff retries, and **Redis**-backed job orchestration
- Engineered multi-tenant data isolation using request-scoped TenantContext, **JWT authentication** (httpOnly cookies + optional Bearer gate), **RBAC** (SUPER\_ADMIN / TENANT\_ADMIN / MANAGER / USER), CSRF double-submit protection, bcrypt password hashing, helmet/CORS, and global + per-route rate limiting — with tenant-scoped Mongoose repositories and defense-in-depth query filtering ensuring zero cross-tenant data leakage
- Built **LLM** integration with **OpenRouter** (deepseek/deepseek-chat): prompt engineering, JSON-mode completions, robust parsing, **Zod** schema validation, 2-attempt retry logic, SHA-256 content-hash deduplication, 3-tier caching (Redis → MongoDB → generate), on-demand risk deep-dives, and cost controls (per-tenant daily AI quotas, chat IP limits, signed session cookies) — cutting redundant API spend and abuse risk
- Delivered a **Next.js** dashboard (ideas pipeline, portfolio analytics, live polling UX), a public marketing site, and an anonymous AI chat copilot, deployed on **Render** (Web Services + Key-Value Redis) with **MongoDB Atlas**; hardened the platform with audit logging, global error sanitization, input validation, and CSRF-protected mutations across **40+** frontend modules to ensure production-grade security and reliability

### PokeDex Platform | [Next.js](#), [NestJS](#), [MongoDB](#), [TypeScript](#), [PostgreSQL](#)

[Live Demo](#)

- Built a full-stack Pokédex app with **Next.js 14** (App Router) and a **NestJS REST API**, using **MongoDB/Mongoose** and **PostgreSQL** for data persistence, with **TypeScript** across client and server for type-safe development
- Implemented **JWT authentication** with HttpOnly cookies, refresh tokens, and **CORS** for secure cross-origin sessions; added a guest mode with per-feature usage limits and automatic data cleanup on logout
- Developed interactive features including a battle simulator, Pokémon comparison, team analyzer, and favorites/profile with battle history, backed by **Axios** API integration and server-side PokéAPI sync with live pagination
- Deployed frontend and backend as separate **Render** web services with **MongoDB Atlas**, environment-based configuration, and production build optimizations for **CI/CD**-style deploys on a monorepo structure

## EDUCATION

### Post Graduate Diploma in Advanced Computing (PG-DAC)

C-DAC, Mumbai

March 2023 – Sept 2023

Percentage: 68.25%

### Bachelor of Engineering

Savitribai Phule Pune University

June 2015 – June 2018

Percentage: 65.00%

### Diploma in Engineering

Shri. Bhagubhai Mafatlal Polytechnic (Autonomous)

Jan 2011 – May 2015

Percentage: 74.00%

## CERTIFICATIONS

### Scrum Fundamentals Certified (SFC)

SCRUMstudy

Dec 2024
